

ListFolder

(Information and examples taken from the DroidScript documentation)

Description

The **ListFolder** method lists all the files and sub folder names in a given path to a comma separated list.

The 'filter' parameter is an optional text parameter which allows you to specify a filter pattern. For example to find only mp3 files, you would specify ".mp3" as a filter

Note: You can use the JavaScript 'split' function to convert the list to a JavaScript array if required.

```
list = app.ListFolder( path, filter, limit );
```

Example - Basic

```
function OnStart()
{
    list = app.ListFolder( "/sdcard" );
    app.ShowPopup( list );
}
```

Example - Filtered

```
function OnStart()
{
    list = app.ListFolder( "/sdcard", ".mp3" );
    app.ShowPopup( list );
}
```

Example - Limited

```
function OnStart()
{
    //Find first ten mp4 files on internal sdcard.
    mp4List = app.ListFolder( "/sdcard", ".mp4", 10 );
    app.ShowPopup( mp4List );
}
```

```
}
```
