

GoToSleep

(Information and examples taken from the DroidScript documentation)

Description

The **GoToSleep** method forces the screen to turn off and puts the device to sleep. This has the same effect as pressing the power button.

```
app.GoToSleep();
```

After using this function rotating the phone/tablet will have no effect on the app's orientation. To unlock the orientation call the function again using the orientation "Default".

Example

```
function OnStart()  
{  
    app.GoToSleep();  
}
```
