

GetLastButton

(Information and examples taken from the DroidScript documentation)

Description

The **GetLastButton** method returns the last button control that was touched by the user. This can be useful when you want to use a single callback function for multiple buttons.

```
app.GetLastButton();
```

Example

```
function OnStart()
{
    lay = app.CreateLayout( "Linear", "VCenter,FillXY" );

    btn1 = app.CreateButton( "Button 1" );
    btn1.SetOnTouch( HandleButton );
    lay.AddChild( btn1 );

    btn2 = app.CreateButton( "Button 2" );
    btn2.SetOnTouch( HandleButton );
    lay.AddChild( btn2 );

    app.AddLayout( lay );
}

function HandleButton()
{
    var btn = app.GetLastButton();
    app.ShowPopup( btn.GetText() );
}
```
